

## Product Information

### Robotic Testing System 'roboTest R' (Polar) for plastic

Robotic testing system 'roboTest R' for testing of plastics

### Application

The robotic testing system is used for the fully automatic performance of tensile and flexure tests on plastics specimens (e.g. according to ISO527-2, ISO 178 or ASTM D638). Additional tests like pendulum impact test can be carried out, too.

### System Configuration

- Materials testing machine 5 kN up to 2000 kN with symmetrically closing, pneumatic or hydraulic specimen grips and an optional extensometer
- Specimen magazine for up to 400 specimens (depends on specimen dimensions)
- Robotic feeding system 'roboTest R' with 6-axial industrial robot
- Barcode scanner (optional)
- Cross-section measuring device (optional)
- Other devices (see options)
- Industry Controller with test software *testXpert*® and automation software *autoEdition2*

### Advantages of the Robotic Testing System 'roboTest R'

- A high reproducibility of the test results is obtained because operator influences are excluded (hand temperature, moist hands, eccentric or inclined insertion of specimens etc.).
- Qualified laboratory staff is relieved of routine jobs and is thus available for more complex activities.
- The machine can be used during idle times (break, night shift) and thus increases the rate of utilization and allows „quicker“ results.
- For increasing the specimen throughput several materials testing machines can be integrated.
- The modular system makes an economical adaptation to specific customer requirements possible.
- The system reduces the testing costs per specimen and usually pays off within one to two years.
- For manual tests the robot arm can be moved to 'park' position, allowing operator free access to materials testing machine.
- Due to the precise centering of the specimen in the cross-section measuring device and the automation of the measuring sensors, the specimen dimensions can be exactly measured.
- The usage of state-of-the-art web-technologies ensures a constant process control and remote diagnostics of the robotic testing system. Results as well as status messages can be sent directly per email or SMS.
- The automatic data logging system ensures secure documentation and enables statistical long-term monitoring (Statistical Process Control).
- The components of the robotic testing system are not subject to wear; they are maintenance-free and designed for three-shift operation.

## Product Information

### Robotic Testing System 'roboTest R' (Polar) for plastic

Automatic measuring of the cross-section

### Test Sequence

- The user fills the specimen magazine directly on the test system or outside the system. The filling of the magazine can be done also during operation.
- The specimen data (ident number, width, thickness,...) are entered on the PC. In barcode operation this step can be omitted.
- After the startup of the system, specimen feed, test and removal of the specimen rests are carried out automatically. The order of testing can be controlled by the operator. A specimen rests removal with good/bad sorting is possible by corresponding inputs.

### Technical Data

#### Mechanics

|            |                          |
|------------|--------------------------|
| Dimensions | depends on the equipment |
| Weight     | depends on the equipment |

#### Connected values

|                         |                            |
|-------------------------|----------------------------|
| Electrical connection   | 230/400 V                  |
| Input / Output          | up to 80 kVA <sup>1)</sup> |
| Mains frequency         | 50/60 Hz                   |
| Compressed air          | 6 bar                      |
| Required compressed air | from 10 lpm <sup>1)</sup>  |

<sup>1)</sup> depends on the equipment

#### Control

|                       |              |
|-----------------------|--------------|
| Automation            | autoEdition2 |
| Peripheral connection | PROFIBUS     |

#### Specimens

|                |                                      |
|----------------|--------------------------------------|
| Specimen type  | dumbbells, stripes                   |
| Capacity       | depends on specimen dimensions       |
| Material       | dimensionally stable, non-adhesive   |
| Length         | max. 260                             |
| Shoulder width | 6 ... 25 mm                          |
| Thickness      | max. 15 mm                           |
|                | other specimen dimensions on request |

#### Options

- Specimen identification by barcode
- Cross-section measuring (1 or 3 measurements per specimen)
- Hardness measuring
- Scale
- Temperature chamber
- Specimen removal
- Good/Bad sorting
- Data exchange with superior processor systems (e.g. LIMS) via upload/download of ASCII-files or ODBC
- Optical status indicator by threefold „traffic light“ (running, refill specimens/finished, error)
